Modeling Social Data
May 2015

Background

- Papers in the sciences.
- Open access.
- Curated, moderated submissions are categorized and have standardized metadata.
- Categorizing automatically would add convenience for users and moderators.

Open access to 1,036,224 e-prints in Physics, Mathematics, Computer Science, Quantitative Biology, Quantitative Finance and Statistics

  <title>KnightCap: A chess program that learns by combining TD(lambda) with
game-tree search</title>
  <summary> In this paper we present TDLeaf(lambda), a variation on the
TD(lambda)
algorithm that enables it to be used in conjunction with game-tree search. We
present some experiments in which our chess program ``KnightCap'' used
TDLeaf(lambda) to learn its evaluation function while playing on the Free
Internet Chess Server (FICS, fics.onenet.net). The main success we report is
that KnightCap improved from a 1650 rating to a 2150 rating in just 308 games
and 3 days of play. As a reference, a rating of 1650 corresponds to about level
B human play (on a scale from E (1000) to A (1800)), while 2150 is human master
level. We discuss some of the reasons for this success, principle among them
being the use of on-line, rather than self-play.

Classification

Naive Bayes with tweaking

- Straightforward approach
 - 50/50 split, sparse matrix with counts, train NB
- tf-idf to emphasize words unique to summaries
- n-gram ($n=1,2,3$) to check if neighbors/phrases played a role.

Results

- Accuracy around 81%
 - 'pure' NB: 0.8115
 - tf-idf: 0.8146
 - n-gram: 0.8035
- Confusion matrices show issues with cross-categorization

Issues

- Articles sometimes have multiple categories.
 - Galaxies and Cosmology often overlap due to subject matter
 - Stars/High Energy also categorized into Galaxies
- Some categories had fewer entries than others (hassle in acquiring data).

Next Steps

- Account for cross-categorization.
 - Store multiple categories, train with main one, count as correct if any one is categorized.
- Try to classify just with titles or authors with large arXiv archive.
- SVM instead of NB for text?
- Graph neighbors/clusters for authors?
- Across many categories and subcategories.
